Alliance Public Study Result Summary
in Follicular Lymphoma
Study Number C50904

What this study is about

A cancer study that looked at whether adding bortezomib to ofatumumab + bendamustine in patients with untreated follicular lymphoma lived longer and/or lived more time before the disease worsened.

The full title of this study is: A Randomized Phase II Trial of Ofatumumab and Bendamustine vs. Ofatumumab, Bortezomib (NSC # 681239) and Bendamustine in Patients With Untreated Follicular Lymphoma

Why the study was done

This study was done to see if adding bortezomib to ofatumumab + bendamustine in the treatment of patients who have not had previous treatment for Follicular Lymphoma resulted in those patients living longer and/or living more time before the disease worsens.

Study results

These results are for people with follicular lymphoma that had not had previous treatment.

The study found that adding bortezomib to ofatumumab and bendamustine did not help patients live longer or live more time before their disease worsened.

The most common serious side effects included:

**ARM A:**
Overall blood related side effects were experienced in 68 out of every 100 patients (68%)

Which includes:

- 52 out of every 100 patients (52%) had lymphopenia (decreased white blood cells)
- 36 out of every 100 patients (36%) had neutropenia (low number of immune system cells that kill bacteria)
- 5 out of every 100 patients (5%) had fatigue (feeling tired)
- 5 out of every 100 patients (5%) had diarrhea (loose watery poop)

**ARM B:**
Overall blood related side effects were experienced in 66 out of every 100 patients (66%)

Which includes:

- 55 out of every 100 patients (55%) had lymphopenia (decreased white blood cells)
- 31 out of every 100 patients (31%) had neutropenia (low number of immune system cells that kill bacteria)
- 13 out of every 100 patients (13%) had fatigue (feeling tired)
- 11 out of every 100 patients (11%) had diarrhea (loose watery poop)
Alliance Public Study Result Summary
in Follicular Lymphoma
Study Number C50904

- 8 out of every 100 patients (8%) had nausea* (feeling sick to your stomach)
- 8 out of every 100 patients (8%) had vomiting **(being sick to your stomach, throwing up)

*nausea was only reported in Arm B patients
**vomiting was only reported in Arm B patients

What the results mean

This means patients in Arm B appeared not to benefit from adding bortezomib to their treatment. It is not recommended that bortezomib be added to the first round of treatment in follicular lymphoma. Adding bortezomib did not result in patients living longer and/or living more time before the disease worsens.

Side effects were worse when bortezomib was added to treatment leading to severe fatigue, vomiting and neuropathy. The severe side effects led to more patients requiring lowering of treatment doses and fewer patients were able to complete the planned treatment and maintenance cycles.

These results were unexpected, but it was anticipated, that a longer follow-up of patients would provide more insight into the survival of high-risk patients.

How the study worked

Here is a picture that explains how patients were placed into this study.

After registration patients were randomized by a computer to Arm A or Arm B

Randomization is the process by which patients are assigned by chance to separate groups.
Alliance Public Study Result Summary
in Follicular Lymphoma
Study Number C50904

Treatment Phase
1 Cycle is 35 days
- Ofatumumab 300 mg was given IV on day 1 of cycle 1 and 1000 mg was given on day 1 of cycles 2-6, immediately prior to bendamustine
- Bendamustine 90 mg/mm² given IV over 30-60 minutes on days 1 and 2 of each cycle
- Bortezomib 1.6 mg/mm² (IV or SC) on days 1, 8, 15, and 22 of each cycle

Maintenance Phase
1 Cycle is 56 days during maintenance.
- Ofatumumab 1000 mg given IV on day 1 of each cycle
- Bortezomib 1.6 mg/mm² (IV or SC) on days 1, 8, 15, and 22 of each cycle.

When did the study start and end? The study started in April 2011. All patients were enrolled by the end of April 2016.

How many patients joined? 135 patients agreed to be in this study. Only 128 patients completed the study. 66 patients joined Arm A and 62 patients joined Arm B.
